

FM IF amplifier with demodulator

TBA 120 S
TBA 120 AS

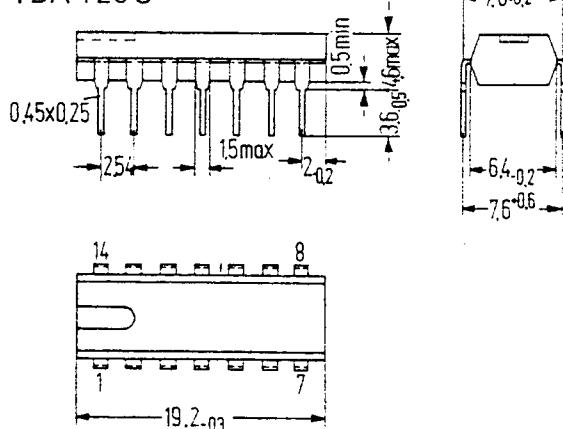

Symmetrical 8-stage amplifier with symmetrical coincidence demodulator for amplification, limiting and demodulation of frequency-modulated signals, especially suited for the sound IF units in TV sets and FM IF amplifiers in radio sets. The circuit is directly interchangeable with TBA 120/A (pin-compatible).

- Outstanding limiting qualities
- Very good frequency stability of converter characteristic
- Wide range of operation (6 to 18 V)
- Very low external component requirement
- Voltage for AFT

Test circuit

Recommended application circuit (5.5 MHz)

Pins 3 and 4 are connected to collector and base of a transistor, respectively, which may be used as an AF preamplifier ($I_c \leq 5$ mA) or as a bass/treble switch (dc on- or off-switching of a RC-circuit).

At pin 12 a Z diode (12 V) is accessible which can be used to stabilize the supply voltage of this integrated circuit or the voltage of other circuit elements in the set ($I_Z \leq 15$ mA).

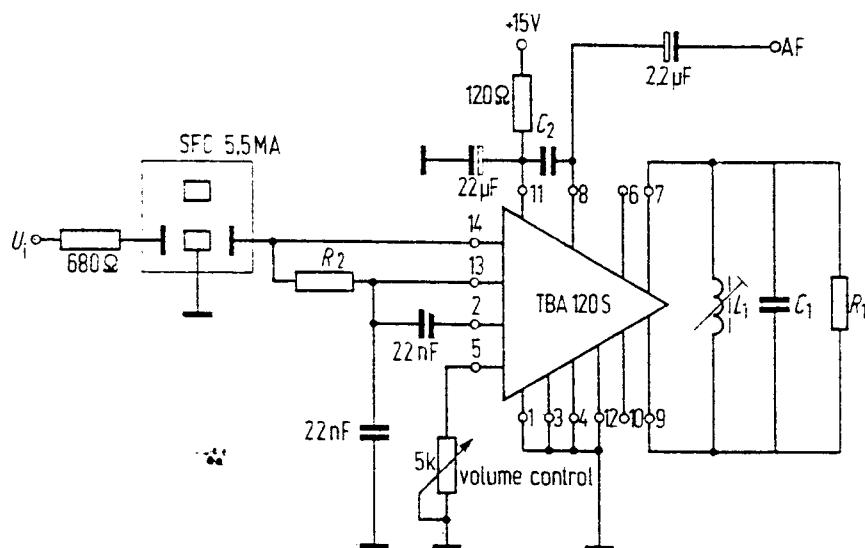

The integrated circuit TBA 120 S is supplied in different groups. Parameter is the volume. A decrease of 30 dB requires a resistor between pin 5 and ground with a resistance value depending on the group number as shown below. The group number is imprinted on the plastic package.

R 5	1.9 to 2.2	2.1 to 2.5	2.4 to 2.9	2.8 to 3.3	kΩ
